

## V-TECH - THE NEW BM SPECIALISTS FOR THE UK

### Handheld control via smartphone and tablet with BM FlexCheck software

The BM14200 can be supplied with a PC Windows program, BM FlexCheck, which can be installed on a PC placed either integrated into a special vehicle inspection bench with touch-screen control or inside a traditional PC cabinet. In conjunction with BM FlexCheck, the BM14200 can be supplied with a Smartphone/Tablet, which communicates wirelessly (WLAN) with the BM14200.

- The inspector can at any time choose any lane and any vehicle, as all inspection data continuously are sent to—and processed by the selected lane PC.
- The inspector can use the app to operate the test line (brake tester and suspension tester), which eliminate the need for more than one hand held unit.
- The app makes the test procedure and data flow transparent for the inspector, which reduces both the risk of errors and the need for initial training and education of staff.
- All items are uniquely identified in the BM FlexCheck Configuration program and each item at the same time optionally linked with item-unique Location, Fault, Reason, Comments and photo options.
- The PDA technology allows for installation of other non-BM programs, which are considered beneficial for the vehicle inspection work.
